1914. This is, therefore, the first instance of its occurrence in the basin of the Delaware River, as well as the most eastern and northern locality at which the species has been obtained. The species is of further interest in not having been secured in Pennsylvania since its discovery in the Conestoga in 1864, by Jacob Stauffer. The type, Stauffer's specimen, has been compared in this connection, and agrees in most all respects. It is, however, over three inches in length, though in various works the species is given as of smaller size. Recently Messrs. Radcliffe and Welsh have described a darter from Swan Creek, Maryland, as new, under the name *H. sellaris*. My example differs in having the spinous dorsal more conspicuously lower than the rayed dorsal, one more dorsal spine, naked cheeks and coloration. The additional dorsal spine would appear an intermediate character. *H. sellaris* is shown with the spinous dorsal marked with three dark blotches to each spine, whereas in my example, at present, the dark blotches are only on the membranes. The dark blotches on the back are such as may easily admit of change with age, the Swan Creek specimens being small. Besides the crustaceans *Asellus communis* and *Gammarus fasciatus*, other fishes found in Skippack Creek were *Notropis procne*, *N. whiplii analostanus*, *N. cornutus*, *Rhinichthys atronasmus*, *Fundulus diaphanus* and *Boleosoma nigrum olmstedii*. In the brook near Rahn, another Perkiomen tributary, *Semotilus atromaculatus*, *Catostomus commersonnii* and *Micropterus dolomieu* were found, and in Landis Brook near Grater's Ford, besides *Fundulus* and *Rhinichthys*, *Notropis whiplii analostanus* and *Lepomis auritus*.

In the Delaware and its tributaries in Bucks County I met with several species of local interest. One was the *Exoglossum maxillingua* in the river at Morrisville, on July 22, with *Notropis hudsonius amarus*, *N. whiplii analostanus*, *Fundulus heteroclitus macrolepidotus*, *F. diaphanus*, *Lepomis* and *Boleosoma*, showing its association with upper tidal species. In a small tributary above Yardley, *Notropis bifrenatus*, *N. whiplii analostanus*, *N. cornutus*, *Rhinichthys*, *Catostomus* and *Boleosoma*

were common. In Taylorville, Knowles and Pidcock's Creeks, *Semotilus atromaculatus*, *Notropis bifrenatus*, *N. whiplii analostanus*, *N. cornutus*, *Rhinichthys*, *Fundulus diaphanus*, *Lepomis* and *Boleosoma* were about equally abundant. *Pimephales notatus* and *Semotilus bullaris* were peculiar to Taylorville Creek, while *Hybognathus nuchalis regius* and *Esox americanus* were only found in Knowles, and *Catostomus* occurred in both. This is the first instance of *Pimephales* in this section, though I have it from further west, or the Schuylkill. *Rhinichthys* was the only fish found in Cuta-loosa Creek. In Brock Creek near Roelofs, *Esox americanus*, *Notropis cornutus*, *Erimyzon sucetta oblongus* and *Boleosoma* were found, the last two also occurring in isolated pools in the course of Common Creek near Fallsington, associated with *Notropis bifrenatus*, *Aphredoderus sayanus* and *Enneacanthus gloriosus*. The last species was also met with in the creek near the village of Penn's Manor, with *Abramis crysoleucas*, *Ameiurus nebulosus*, *Schilbeodes gyrrinus*, *Fundulus diaphanus*, *Apeltes quadracus*, *Lepomis auritus* and *Eupomotis gibbosus*. In Chester County, in the various headwaters of the White Clay Creek, near Londongrove, only *Salvelinus fontinalis*, *Rhinichthys* and *Boleosoma* were met with abundantly.
